*Project on -
Need for a High-Performance Game Analytics Platform*

Briefing

The client operates a CLOUD GAMING SERVICE , delivering high-performance gaming experiences through streaming. They manage vast amounts of data generated by users, including gameplay interactions and system metrics, and require efficient data processing, real-time analysis, and robust security to ensure smooth gameplay and optimal user engagement.

Challenges

- Difficulty **querying and analyzing** massive gaming dataset.
- Trouble in quickly processing big datasets for **real-time decisions**.
- Worries about managing **data security** and who can access it.
- Challenges in **coordinating** different systems across multiple servers.
- Problems with **automating** and scheduling important data tasks.
- Issues with **storing** and handling large amounts of data efficiently.

Consequence

- **Performance Issues:** As the number of players grew, the system encountered significant performance bottlenecks, leading to slower game performance and reduced player satisfaction.
- **Revenue Impact:** The lack of real-time insights into player activity affected the ability to monetize effectively, leading to a negative impact on revenue.
- **Understanding Player Preferences:** Analyzing player behavior and preferences was challenging, resulting in missed opportunities to enhance in-game experiences.

Solution

To address the numerous challenges faced by our client, we delivered a range of tailored services as comprehensive solutions.

- **AWS S3** for Data storage.
- **AWS Athena** for Data Querying.
- **AWS Kinesis** for real-time ingestion of Logs and events.
- **AWS EMR** for large-scale batch and streaming processing with spark on EMR.
- **AWS IAM** for Data Security and Access Control.
- **AWS Glue** for automated ETL pipelines and maintaining a centralized data catalog.
- **AWS CloudWatch** for monitoring performance and setting up real-time alerts.

Impact

- **Subscription Upgrades:** A 19% increase in players opting for premium subscriptions.
- **Campaign Scalability:** Ability to run 7 times more marketing campaigns simultaneously.
- **Personalized Gaming:** Refined targeting algorithms elevated player engagement and satisfaction.
- **Predictive Analytics:** Enhanced algorithms identify player goals, increasing in-game transactions.
- **User Research:** Deeper insights into player behavior, improving game development.

Cluster & Capacity Planning

- **Daily Ingestion Volume:** 40 GB/day
- **Average Throughput:** ~0.5 MB/sec (40 GB ÷ 86,400 sec).
- **Peak Throughput:** ~2.5 MB/sec (Assuming 5x spike during game launches).
- **Event Rate:** ~500 - 2,500 events/sec (Assuming avg log size of 1KB).
- **Total Data Stored:** ~35 TB (20 TB Historical + 15 TB Yearly Growth).
- **Storage Strategy:**
 1. **S3 Raw Zone:**

Volume: 40 GB/day.

Cost Efficiency: Since 40GB is small, we use **S3 Standard** for the first 30 days, then **Intelligent-Tiering** moves it to Infrequent Access (IA) automatically.
 2. **S3 Processed Zone:**

Volume: ~5 GB/day (Aggregated/Cleaned Parquet is usually 10-15% of raw JSON size).

Cluster & Capacity Planning

KINESIS CAPACITY:

- 1 Shard = 1 MB/sec write capacity.
- Throughput: ~0.5 MB/sec (Automatically handled by On-Demand Mode.
- Retention: 7 days (not default 24 hrs) for replay capability

EMR CLUSTER:

- Master: 1x m5.xlarge (On-Demand)
- Core: 2x m5.xlarge (On-Demand)
- Task: 2x m5.xlarge (Spot Instances)

S3 STORAGE:

- Raw Zone: 40 GB/day → 14 TB/year
- Processed Zone: 5 GB/day (after aggregation)
- S3 Intelligent-Tiering moves data to IA after 30 days.
- Est. Storage Cost: ~\$100 - \$150 / month (Very affordable).

ATHENA:

- Estimated scans: 1-2 TB/week → ~\$5-10/week in query costs.
- Partition Projection reduces query planning latency by 90%

AWS SERVICES USED

- **Ingestion Layer** : Kinesis Data Streams (On-Demand), Kinesis Data Firehose
- **Storage Layer**: S3 (Standard → Intelligent-Tiering), Glue Data Catalog
- **Processing Layer**: EMR (Transient Cluster + Spark), Spot Instances (Cost Optimization)
- **Analytics Layer**: Athena (Partition Projection for speed), Glue Crawler (Schema Discovery)
- **Visualization**: QuickSight (SPICE for cost, Direct Query as fallback)
- **Security & Ops**: IAM (Role-based), VPC Endpoints (S3 cost savings), CloudWatch (Monitoring).

FLOW DIAGRAM

It shows the end-to-end data pipeline:

- Game Clients → Kinesis Data Streams → Kinesis Firehose → S3 Raw Zone (Parquet) → Glue Crawler → Glue Data Catalog → [Split into TWO paths]
 1. Real-Time Path (Future): → Lambda (Fraud Detection)
 2. Batch Path: → EMR (Spark - Deduplication + Aggregation) → S3 Processed Zone → Athena → QuickSight“
- With supporting services: IAM (Roles for each service), CloudWatch (IteratorAge, DPU metrics), VPC Endpoints (S3 access from private subnets)

ARCHITECTURE

VPC

- Deployed workloads inside secure VPC with private/public subnets.
- NAT Gateway enabled controlled internet access for private subnets.

The screenshot displays the AWS Management Console interface for the 'us-east-1' region. The left sidebar shows the navigation menu with 'Subnets' highlighted under the 'VIRTUAL PRIVATE CLOUD' section. The main content area is titled 'Subnets (4)' and shows a list of subnets for the VPC 'hadoop_vpc'. The subnets are: Private_subnet03, Private_subnet02, Private_subnet01, and Public_subnet, all in an 'Available' state. The bottom of the console shows the footer with '© 2021, Amazon Internet Services Private Ltd. or its affiliates.' and links for 'Privacy', 'Terms', and 'Cookie preferences'.

IAM Roles

1. Kinesis Producer Role (for game clients)

- Permissions: `kinesis:PutRecords`
- Assumed by Game Server/Client via Cognito or Web Identity Federation (STS)

2. Firehose Role

- Permissions: `s3:PutObject` (for Raw Zone)
- Permissions: `glue:GetTableVersion` (for Parquet schema)

3. EMR Cluster Role

- Permissions: `s3:GetObject` (Raw Zone), `s3:PutObject` (Processed Zone)
- Permissions: `glue:GetDatabase`, `glue:GetTable` (for Glue Catalog) - Permissions: `cloudwatch:PutMetricData` (emit custom metrics)

4. Athena Role

- Permissions: `s3:GetObject` (Processed Zone)
- Permissions: `glue:GetTable`, `glue:GetPartitions` (read catalog)

5. QuickSight Role

- Permissions: `athena:StartQueryExecution` (if Live)
- OR: `s3:GetObject` (SPICE mode, one-time import)

Overview

- Using AWS for cloud-based high-graphics gaming, the company enhanced operational efficiency and user experience.
- AWS's real-time analytics identified performance bottlenecks, allowing quick adjustments that improved gaming performance.
- Additionally, AWS enabled precise monitoring of gaming transactions, quickly spotting unusual data usage and fraud, thus reducing fraudulent activities that previously went undetected.
